Section 4.4

- 1. Let X and Y have joint density  $f(x, y) = \frac{1}{2}$  for  $0 \le x \le y \le 2$ .
  - (a) Suppose you know that  $X = \frac{2}{3}$ . What does  $f(\frac{2}{3}, y)$  tell you about the density of Y, given that  $X = \frac{2}{3}$ ?
  - (b) Suppose you know that  $X = x_0$ . What is then the density of Y?
  - (c) In part (b), you found the conditional density  $f_{Y|X}(y \mid x_0)$ . How does this relate to the joint density f(x, y) and the marginal density  $f_X(x)$ ?
  - (d) If  $X = \frac{2}{3}$ , then what is the probability that  $Y \le 1$ ?
  - (e) What is the expected value of Y given that  $X = x_0$ ?

- 2. The joint pdf of X and Y is f(x, y) = 3x, for  $0 \le y \le x \le 1$ .
  - (a) What is the conditional distribution of X given Y = y?

(b) What is  $E(X \mid Y = y)$ ?

(c) What is Var(X | Y = y)?

3. For continuous random variables X and Y, show that  $E(E(X \mid Y)) = E(X)$ .

4. The number of eggs N found in nests of a certain species of turtles has a Poisson distribution with mean  $\lambda$ . Each egg has probability p of being viable, and this event is independent from egg to egg. Find the mean and the variance of the number of viable eggs per nest.

**★ BONUS:** If X and Y are independent binomial random variables with identical parameters n and p, calculate the conditional expected value of X given that X + Y = m.
